WE CLAIM:

- 1. A direct and non-destructive method for measuring recess depth in a semiconductor wafer through use of a solvent, comprising:
 - a) placing a recessed wafer into a track;
 - b) pouring a solvent into the wafer;
 - c) commencement of spinning the track-wafer-solvent to recess said solvent into the wafer trench solvent;
 - d) subjecting the track-wafer-solvent from step c) to a subsequent spinning step to spin-off any remaining solvent on the surface of said wafer to leave the wafer trench filled with solvent;
 - e) weighing the solvent-filled-trench wafer;
 - f) subjecting the solvent-filled-trench wafer to heating to remove said solvent; and
 - g) weighing the solvent-free wafer to determine the difference in weight, and using the density of the solvent together with the difference in weight to determine the recess depth.
- 2. The method of claim 1 wherein said solvent is an organic solvent.
- 3. The method of claim 2 wherein said solvent is characterized by a density of about 1.4g/cm³.
 - 4. The method of claim 3 wherein said semiconductor device dimension is 0.13um or less.
 - 5. The method of claim 1 wherein said semiconductor device is a 110nm DRAM product characterized by 308 chips per 8 inches of wafer, and a half billion trenches per chip.
 - 6. The method of claim 5 wherein each trench has a width of 125nm, a length of 220nm and a depth of 1.3um.

- 7. The method of claim 6 wherein the total volume of trench filled-up with said solvent is about 4.3mm³.
- 8. The method of claim 7 wherein said weight difference is about 6mg.
- 9. The method of claim 1 wherein said recess is a polysilicon recess.
 - 10. The method of claim 9 wherein said polysilicon recess results from an ASG or a LOCOS process.
